-1- SUBCNIT: F-TYPE ATPASES HAVE 2 COMPONENTS, CF(1) THE CATALYTIC CORE AND CF(0) THE MEMBRANE PROTON CHANNEL CF(1) HAS FIVE SUBURITS ALPHA 19, BETA(1), SAMMO C.

INSTITUTE MAIN SUBURITS A, B AND C.

SUBCELLULAR LOCATION: Chloroplast thylakoid membrane.

SIMILARITY: Belongs to the ATPASE alpha/heta chains family. Interero, PROSOUS4, ATPASE ALPASE alpha/heta chains family.

ACP Synthesis: Chloroplast, Thylakoid, Membrane, CF(1);

ACP Synthesis: Chloroplast, Thylakoid, Membrane, CF(1);

ACP Synthesis: Chloroplast, Indianaport.

The present invention relates to linkage methodology for use in the conjugation of compounds (e.g. peptides) to carrier vehicles

(e.g. macromolecules, polyeers, dendrimers, proteins) to produce biological and imminological constructs. The invention provides a protein biological and imminological constructs. The invention provides a protein for use in a pharmaceutical composition or a vaccine. The invention describes peptides derived from or mimotopes of the cinematory cepsilons of the invention are used to produce conjugated compounds. The compounds or compositions of the invention are useful in the manufacture of a compositions of the invention are useful in the manufacture of a medicament for the treatment of IgE medicated diseases. The invention allows for controlled conjugation of a peptide epitope (antigen) to a protein so as to form an imminogenic conjugate which may be able to raise a protective antibody response in an animal or human patient.

The Cupsilon2/Cupsilon2/Cepsilon4 region of human igs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Immunogen, human, 195, immunoglobulin E, allergy, thio ether linkage, vaccine, antialleranc, cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                A linkage comprising an incunogenic conjugate useful treatment of mediated diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

for treating allorates comprising (II), (3) a ligand (IV) capable of recognising EL. (4) a pharmaceurical composition (PC) comprising (IV).

(5) a peptide (1a) capable of being recognised by (IV), (6) an immunogen (IV) comprising (IV) and (IV).

(5) a second and of the composition of the producing (IV).

(8) a second and historian release inhibitor. (I), (II) and (III) are useful in medicine and in the Taundacture of medicaments for treating and preventing allergues. (IV) is useful for identifying mimortopes of PL, in comparing medicaments for treating allergues. (IV) is useful for identifying mimortopes of PL, in engines. (IV) is useful in claded of the preventing and in the affinity purification of useful for identifying mimortopes of PL, in clading and in the affinity purification of inserting and includes from blood. (II) (III) and PC are useful for useful in claded and and and and allergues. (IV) is also useful in claded another exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention eviates to inkage methodology for use in the minimal of organization (sometimens) to carrier vehicles via minimal organization produce the continual and immediate of produce the continual and immediate organization provides a city of the continual organization or a provides a troteol organization or a provides a troteol for second organization or a vaccine. The prisont invention relates to conjugates suitable for use in vaccines, where the conjugate complises a dissilphide bridge cyclised peptide and an armunogatic carrier. The vaccines can be used in the treatment of allergies. The present sequence is a cyclic peptide immunogen derived from human immunoglobulin 8 (198) suitable for use in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         !mmunngen; human; igE; irmunoglobulin E; allergy; thio-ether linkage;

The present invention describes an immunogen (I) comprising a peptide (I) and a carrier (IP) derived from protein D of Haemophilus influencae or its fragment. Also described are: (I) a vaccine comprising (I). And an excipient, (I) pickatation of (I), comprising conjugating a peptide to protein D or its fragment, and (I) preparation of a vaccine of (I), and comprising framilating (I) with an excipient. (I) has eyecate of (I), and the vaccine are useful for the manufacture of a medicament for preventing and treating infectious diseases such as malaria or chronic disease such as cancer, Alzbeiger's disease or altergy in a patient. Unlike prior art immunogens (I) induces high levels of antipeptide carrier. The present sequence represents a specifically claimed carrier. The present sequence represents a specifically claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Epitope, mimotope, human, inmunoglobulin E, 195; C-epsilon-2 domain, allergic disease, immunoprophylaxis, immunotherapy, antiallergic; immunosuppressive, vaccine, histamine release inhibitor; immunogen;
cancer, comprises peptide and carrier from protein D of influenzae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Greenwood J, Hewart E, Lamont A, Mason S,

                                                                                                                                                                                                                                                                               The present invention relates to conjugates suitable for use in viccines, where the conjugate comprises a dissiphide bridge by listed peptide and an immunogenic carrier. The vaccines can be used in the Treatment of allorgies. The present sequence is a cyclic peptide immunogen delived from human immunoglobulin E (19E) suitable for use in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immissions and vaccine comprising the impublishing to the permitted and treating infectious diseases out, malarity and one include diseases.

The present invention describes a peptide (I) comprising an isolated surface exposed group/epitope (BI) of C-epsilon-2 domain (D) of immunoglobulin E (1981, or its minotope, Also described are: (1) an immunoglobulin E (1981, or its minotope, Also described are: (1) an immunoglobulin E (1981, or its minotope, Also described are: (1) an immunoglobulin E (1981, or its minotope) (II); (2) a vaccine (III) or treating allergies comprising (II); (2) a vaccine (III) or treating allergies comprising (IV); (3) a ligand (IV); (5) a peptide (Ia) capable of being recognised by (IV); (6) an immunoglen (II) or interface (II) and (IV); (6) an immunoglen (II) or corprising (IV); (7) producing (III) by producing (IV); (1) are as a vaccine and instamine release inhibitor. (II) and (III) are useful in medicine and and in the manufacture of medicaments for treating as a vaccine and also in manufacturing medicaments for treating allergies. (I) is useful in diagnostics and in the affinity purification (IV) is also useful in diagnostics and in the affinity printergies. (IV) is also useful in diagnostics and in the ABE609 sepresent (IV) is also useful in diagnostics and in the exemplification of the present
                                                                                                                                                                                                                                                                                          Peptides useful for treating, preventing and ameliozating allergic diseases, comprising an isolated surface exposed group of a specific domain from immunoglobulin E.

The please invention relates to linkage methodology for use in the con quation of compounds legg, peptides) to carrier vehicles

CC con quation of compounds legg, peptides) to carrier vehicles

CC con quation of compounds legg, peptides) to acarrier (e.g. action) for use in a pharmaceutist of method for intuing an epitope (e.g. a peptide) to a carrier (e.g. a protein) for use in a pharmaceutistal composition or a vaccine. The compounds of compositions of the compounds or cepsilon? Cepsilon or describe the compounds or compositions of the invention are used to produce conjugated compounds. The compounds or compositions of the invention are useful in the manufacture of a compositions of the invention are useful in the manufacture of a compositions of the invention are useful in the manufacture of a section or the treatment of 195 mediated diseases. The invention allows for controlled conjugate which may be able to compositions of controlled conjugates in an animal or furan patient.

CC raise a protective antibody response in a naimal or furan patient.
